

Wander — Human-first urban mobility

Live app: cursor-hackathon-2026-07-09.vercel.app

GitHub: github.com/boylekir/cursor-hackathon-2026-07-09

Event: 2026 July 09 Cursor Hackathon

Executive summary

Wander is not a map that optimises for the machine — it optimises for the human walking through the city. It shifts urban mobility from **efficiency to experience**, turning dead commute time into something you can reclaim for mental health, community wealth, and physical vitality.

Modern navigation apps are built for the absolute shortest time. That often means routing people down noisy, high-traffic, concrete-heavy corridors. It increases daily stress and disconnects people from the places they pass through.

Core question: What if your route cared about how you feel, who you meet, and how you move — not just how fast you arrive?

Why now?

Cities are louder, faster, and lonelier than they were a decade ago. People still have to move through them every day — to work, to meet friends, to run errands — but the tools they use treat that movement as a problem to minimise, not a life to live.

The product sits at the intersection of urban mobility, mental well-being, and local economic resilience — three problems that got worse after the pandemic and are still unsolved by incumbents optimising for ETA alone.

Three journey modes

1. MentalClear (Mindfulness)

The antidote to "hurry sickness"

Chronic overstimulation and anxiety are defining features of modern urban life. Concrete corridors, traffic noise, and visual clutter create constant micro-stressors — especially on commutes you cannot avoid.

MentalClear intentionally biases routes toward calmer paths: quieter streets, greener coverage, libraries, historic sites, and low-stress walking distances. It is passive eco-therapy built into a daily chore.

In the app: Choose Mindfulness during onboarding, set your walking pace, and Explore surfaces calmer nearby picks within a comfortable radius.

2. SocialExplore (Social)

Combating the isolation epidemic

Post-pandemic cities struggle with social cohesion. Foot traffic on local high streets has hollowed out while digital commerce concentrates spending away from independent businesses.

SocialExplore routes you past thriving local spots — cafés, markets, bookshops, bars, and independent retail — so discovery is part of the journey, not a separate trip.

In the app: Choose Social, pick vibes (Food / Shops / Drinks), and recommendations lean into meet-up friendly, discovery-oriented places.

3. HealthOptimised

Fighting sedentary lifestyles through preventative movement

Most people cannot find gym time, but they still travel. HealthOptimised turns a static A-to-B walk into a dynamic health route — extra steps and stops woven in while respecting a time budget (~45 minutes or ~1 hour).

In the app: Choose Health-optimised, set your time budget, and the journal planner builds a walking route with added movement automatically.

Spatial shopping planner

Errands are another form of urban mobility that default maps treat as pure efficiency. Wander merges **where you shop** with **how you get there** — so groceries fit into your walk instead of

becoming a separate trip.

Mode	What it optimises for
Scavenger	Cheapest stop per item along your route — hunt deals across multiple supermarkets without a big detour
Efficiency	One supermarket for your whole list — lowest total basket price when live data is available

How it works:

- 1. Type or paste your shopping list on /shop
- 2. Optionally set a destination (or plan from your current location)
- 3. Wander finds real nearby supermarkets via OpenStreetMap
- 4. With LINKUP_API_KEY configured, LinkUp fetches live UK grocery prices from the web
- 5. The planner orders stops by cost (Scavenger = cheapest per item; Efficiency = lowest basket)

Without LINKUP_API_KEY, the planner still works but falls back to route-based supermarket matching (locations only, no live prices).

What you can do in the app

Page	Purpose
/onboarding	Mode-first setup: pick MentalClear, SocialExplore, or HealthOptimised → one follow-up question → launch
/explore	Map and recommendations from your location; toggle journey mode live
/plan	Build a walking journal route through Explore picks to a destination
/shop	Spatial shopping planner with live prices (Scavenger or Efficiency)

Hackathon pitch framing

Don't pitch "a map with filters." Pitch a tool that humanises urban transit.

Wander reclaims the dead time spent moving through cities for mental health (MentalClear), community wealth (SocialExplore), physical vitality (HealthOptimised), and live-priced errands woven into the route itself.

Technology stack

- Next.js 16 (App Router) · React 19 · TypeScript · Tailwind CSS 4
- Supabase — anonymous auth and user preferences
- Google Places API — recommendations, geocoding, walking directions
- OpenStreetMap / Overpass — supermarket discovery
- LinkUp — live web-sourced grocery prices on /shop

Environment variables

Variable	Purpose
NEXT_PUBLIC_SUPABASE_URL	Supabase project URL
NEXT_PUBLIC_SUPABASE_ANON_KEY	Supabase anon key
GOOGLE_MAPS_API_KEY	Server-side Places and Directions
NEXT_PUBLIC_GOOGLE_MAPS_API_KEY	Client-side Maps JavaScript
LINKUP_API_KEY	Live grocery prices on /shop (optional — from app.linkup.so)

Deployment

Production: <https://cursor-hackathon-2026-07-09.vercel.app> (deploys from main branch)
